Microsoft 365 Tenant Security Hardening Project Report

Comprehensive Compliance Baseline & Automation Assessment (CIS Benchmark Aligned)

> **Project Name:** TenantGuard M365 & Security Automation
>
> **Scope:** Identity Governance, Conditional Access, App Consent & Teams Collaboration
>
> **Framework Alignment:** CIS Microsoft 365 Foundations Benchmark & NIST Zero Trust Architecture

1. Executive Summary

This report documents the architectural design, security implementation, and verification results for the **TenantGuard M365** hardening project. Designed for small and medium-sized enterprises with lean administrative bandwidth, this initiative establishes a robust, automated security posture across Microsoft Entra ID and Microsoft 365 E5/E7 cloud services.

By replacing manual portal configurations with Policy-as-Code automation via the Microsoft Graph API, the organization successfully eliminated critical identity-based threat vectors, enforced strict multifactor authentication, blocked legacy authentication protocols, and secured real-time risk remediation workflows.

2. Technical Architecture & Core Controls Implemented

The hardening baseline is organized into five core security domains designed to establish least-privilege access and continuous compliance:

Domain	Security Control	Technical Implementation Details
Privileged Identity	Mandatory Admin MFA	Enforced Conditional Access across all built-in administrative directory roles using the AND grant operator and break-glass exclusions.
Identity Baseline	All-Users MFA Enforcement	Enabled tenant-wide Conditional Access policy covering `All users` and `All resources` with mandatory multi-factor authentication.
Attack Reduction	Legacy Authentication Block	Scoped Conditional Access to block `exchangeActiveSync` and `other` legacy client protocols tenant-wide.
Identity Protection	High User Risk Remediation	Automated interception of high-risk sign-ins requiring MFA and immediate SSPR password rotation with `everyTime` frequency.
Application Governance	OAuth Consent Restriction	Cleared `PermissionGrantPoliciesAssigned` in Authorization Policy, disabling ordinary-user self-consent for third-party apps.
Collaboration	Teams Meeting Hardening	Configured Global meeting policy to block anonymous joins, restrict lobby bypass to invited participants, and enforce organizer-only presenters.

3. Assessment Verification & Validation

The tenant security posture was validated using the automated assessment validation script aligned with the reference output file hardening-results.txt. All implemented controls passed verification successfully without policy drift or configuration conflicts.

- **Total Evaluated Controls:** 9
- **Passed Checks:** 9 (100% Compliance)
- **Failed/Unknown Checks:** 0
