Got feedback?
Control when end users and group owners are allowed to grant consent to applications and agent identities, and when they will be required to request administrator review and approval. Allowing users to grant apps and agent identities access to data helps them acquire useful applications and be productive, but can represent a risk in some situations if it's not monitored and controlled carefully.
User consent for applications
Configure whether users are allowed to consent for applications to access your organization's data. Learn more
Do not allow user consent
An administrator will be required for all apps and agent identities.
Allow user consent for apps from verified publishers, for selected permissions
All users can consent for permissions classified as "low impact", for apps from verified publishers or apps registered in this organization.
Let Microsoft manage your consent settings (Recommended)
Automatically update your organization to Microsoft's current user consent guidelines. Learn more
When user consent for applications is disabled, users may still be able to connect their work or school accounts with LinkedIn. You can manage LinkedIn account connects in User Settings.
